Basic Training Manual and Study Guide for Healthcare Security Officers

This training manual was created to help physician relations managers, Physician liaisons, and any sales professional learn the basic and intermediate skills necessary for work within an acute and post acute care hospital setting. Healthcare has changed dramatically over the years and it is more important than ever to quickly and efficiently get new sales professionals up to speed on the necessary skills to get out in the field and develop necessary relationships for the hospitals. Since time is always something lacking in training new hires and getting them out in the field, this manual will assist with the skills necessary not only to get out and start building relationships but can be used whenever the liaison needs something to fall back on while learning the new position.

Practising fundamental patient care skills and techniques is essential to the development of trainees' wider competencies in all medical specialties. After the success of simulation learning techniques used in other industries, such as aviation, this approach has been adopted into medical education. This book assists novice and experienced teachers in each of these fields to develop a teaching framework that incorporates simulation. The Manual of Simulation in Healthcare, Second Edition is fully revised and updated. New material includes a greater emphasis on patient safety, interprofessional education, and a more descriptive illustration of simulation in the areas of education, acute care medicine, and aviation. Divided into three sections, it ranges from the logistics of establishing a simulation and skills centre and the inherent problems with funding, equipment, staffing, and course development to the considerations for healthcare-centred simulation within medical education and the steps required to develop courses that comply with 'best practice' in medical education. Providing an in-depth understanding of how medical educators can best incorporate simulation teaching methodologies into their curricula, this book is an invaluable resource to teachers across all medical specialties.

It is my hope that this text, when properly used will be of great benefit to the individual aide or aide in training in mastering the required skills that would make the individual a good home health aide. The book has been specially tailored as a teaching tool for home health aides. The book has two sections, the tutorial section one and the practical hands on section.
two. The second section is a good aide or good training tool for practical demonstration purposes. For the purpose of understanding only, a home health aide does not have to be a Certified Nurses Aide. As a result this book can be used to train and prepare an individual to function in the capacity of a home health aide. The agency must prepare a set of standardized tests for the aides to ensure that the individual have fully internalized the reaching and training that they have been put through. This book further addresses the rule and regulation (federal and State) that the home health aide must be familiar with. This book is an excellent tool for the home health aide. I strongly encourage all individuals who practice and plans to practice as an aide in the home health field to read this book.

Back Care Boot Camp

UNIT TEN: Nursing Care Basic nursing skills to address the patient's basic physical needs, prevent and treat pain, and promote a safe, healing environment. This Manual provides a resource for the training of field medics and community health workers who serve in under-resourced areas during conflicts or disasters. It targets those with a basic educational background and little or no prior medical education and, in conjunction with an intensive 4-8 week training program, will allow medics to diagnose and treat the most common 90% of illnesses and traumas. Based on a "Systems" approach (rather than symptom or specific disease orientation), the Manual covers basic anatomy and physiology and then focuses on the symptoms, physical findings, natural history, and differential diagnoses of the illnesses and injuries most likely to be encountered by health workers in the field. Treatment protocols are outlined, using those medications and materials likely to be found in under-resourced environments, including the generic medications of the WHO Essential Drugs List. The purpose is to train field health workers quickly and give them the skills to treat the majority of wounded and ill in situations when whatever previous health care system there may have been is overwhelmed. Developing capacity and self-reliance by training persons from affected areas empowers individuals and communities - even those displaced from their homes - to regain control of their lives and destinies. This is the foundation of emergency humanitarian assistance. This Manual is also meant to be carried into the field as a ready reference for field health workers including trauma medics and community health workers as well as more highly trained medical personnel who may happen to find themselves practicing out of their areas of expertise. This could include national and international physicians, paraprofessionals, and nurses responding to a humanitarian emergency. This Manual does not intend to supersede local or national healthcare systems or protocols, but to provide an adjunct in an emergency when, as often happens, the perfect may be the enemy of the good.
Basic Training Manual for Healthcare Security Officers

This manual is designed to provide primary health care program managers with guidance on how to use cost analysis and cost-effectiveness analysis as tools to achieve better understanding and management of resource flows. Although it has been prepared primarily for program managers at national, regional, and district levels, other health professionals can learn from it through a short training course or by individual study. Part A introduces unit financial costs and provides a first look at the effectiveness of health services, in six modules: what costs are, using cost data, planning the study, calculating costs, measuring effectiveness, and calculating unit financial costs. Part B covers other kinds of costs and compares costs and effectiveness estimates. Topics of the three modules are as follows: measuring and using economic costs, household costs, and cost-effectiveness analysis. In part C, several important uses of cost and cost-effectiveness data for planning and management are discussed and illustrated. Future costs, financial analysis, and managerial efficiency are the topics of the three modules. A set of exercises to be used with the individual modules follow. Appendixes contain the following: annualization factors; 10 resources for further reading, including guidelines and methods and case studies; and an index. (YLB)
