Data analysis elicited three interrelated themes - Role delineation and confusion, Information sharing and The PICU environment - and one overarching theme - Competing Values. The findings identified that FCC was not universally espoused as an important philosophy and was not readily translated into the nurses' practices. A theory-practice gap was revealed in relation to the concepts of FCC. The findings suggest that this gap can be addressed through policy, education, and practice. Highlighted is the need for FCC education, both for nurses and medical staff, and a written policy to guide staff and practice. The importance of providing a child-friendly environment in the PICU is emphasized, as it has a positive impact on the child's healing process and the family's ability to care for the child. The study suggests that the implementation of a comprehensive education and training program for nurses, along with the establishment of a clear and supportive policy, could help to bridge the gap between theory and practice and facilitate the provision of high-quality care in the PICU. The implications of this study for nurses, health care professionals, and policymakers are discussed, and recommendations for future research are made.
